Introduction

Gherkin is a simple language for writing specification by examples. Gherkin is plain-text English (or one of 60+ other languages) with a little extra structure. Gherkin is designed to be easy to learn by non-programmers, yet structured enough to allow concise description of examples to illustrate business rules in most real-world domains.

Keywords

In Gherkin, each line that isn't blank has to start with a Gherkin keyword, followed by any text you like. The main keywords are:

Feature
Scenario
Given, When, Then, And, But (Steps)
Background
Scenario Outline
Examples

There are a few extra keywords as well:

""" (Doc Strings)
| (Data Tables)
@ (Tags)
(Comments)

By using language tag, you can write specifications in your native language. For example, following is a specification in Chinese.

#language: zh-CN
